Wombat Announces Feed Handler for NASDAQ TRACE

March 06, 2006 - Wombat would like to inform you that we have released our feed handler for the NASDAQ Bond Trade Dissemination Service (BTDS) feed for General Availability. Many customers participating in the fixed income markets will find this interesting, given that the BTDS feed includes full coverage of the Trade Reporting and Compliance Engine (TRACE), which captures all trades across the approximately 41,000 securities in the US corporate bond market. As indicated by the name, this data can be used for compliance purposes in validating provision of "best execution" to ones clients.

The TRACE feed handler is supported on the Wombat Platform, TIB, Triarch and RMDS. Trade reports, cancels and corrections are all covered.

Fixed income market participants should also note that Wombat also provided feed handlers from ICAP (IConnect) and the MSRB, and are now in development with a feed handler for Thomson TradeWeb. Furthermore, we're publicly announcing support for Bloomberg's B-Pipe (formerly known as Phatpipe) real-time data feed very soon.
