Wombat Announces Development of CME-MDP TIBRV Proxy

June 09, 2006 - CME intends to discontinue its TIBCO Rendezvous (TIBRV) based feed at the end of July 2006 and has already released its replacement feed, CME-MDP, which is supported by Wombat and delivers data through multiple multicast channels. CME customers wishing to continue receiving data from the exchange must migrate to the new feed format.

Recognizing that this may pose problems for those who have deployed applications written to the RV format, Wombat will soon release a CME-MDP TIBRV proxy application to mitigate the effort required to accommodate this change.

Wombat's CME-MDP TIBRV Proxy converts CME-MDP data into a native TIBRV message stream. The proxy will consume messages arriving on CME-MDP multi-cast channels, and will publish these as a native TIBRV message stream. Customers can therefore avoid the burdens of recoding their software applications upon transition to this new direct feed.
